1. The rated loads are determined according to EN13000 rating on the condition that the machine is stationed on firm, level ground.

2. The figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.

3. To calculate the maximum load that can actually be lifted, deduct weight of all lifting accessories, such as boom hook and jib hook, from figures shown above.

4. Working radius is the horizontal distance from the slewing center to the center of gravity of a lifted load.

5. The counterweight is 49.6 ton.

6. Correlation between the number of reeved lines, maximum rated loads, hook weights are shown in the table below.

Hook Capacity (t)	Hook Weight (t)	Maximum rated loads (t)

1. The rated loads are determined according to EN13000 rating on the condition that the machine is stationed on firm, level ground.

2. The figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.

3. To calculate the maximum load that can actually be lifted, deduct weight of all lifting accessories, such as boom hook and jib hook, from figures shown above.

Hook Capacity (t)	Hook Weight (t)
120	1.64
80	1.35
35	0.90
12	0.51

4. Working radius is the horizontal distance from the slewing center to the center of gravity of a lifted load.

5. The counterweight is 49.6 ton.

1. The rated loads determined according to EN13000 rating on the condition that the machine is stationed on firm, level ground.

2. The figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.

3. To calculate the maximum load that can actually be lifted, deduct weight of all lifting accessories, such as boom hook and jib hook, from figures shown above.

4. Working radius is the horizontal distance from the slewing center to the center of gravity of a lifted load.

5. The offset angles shown are of jib boom offset angle against the main boom, under load.

6. The counterweight is 49.6 ton.

7. Correlation between the number of reeved lines, maximum rated loads, hook weights are shown in the table below.

1. The rated loads are determined according to EN13000 rating on the condition that the machine is stationed on firm, level ground.

2. The figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.

3. To calculate the maximum load that can actually be lifted, deduct weight of all lifting accessories, such as boom hook and jib hook, from figures shown above.

4. Working radius is the horizontal distance from the slewing center to the center of gravity of a lifted load.

5. The counterweight is 49.6 ton.

6. Correlation between the number of reeved lines, maximum rated loads, hook weights are shown in the table below.

7. Cannot be used with 1 fall.

- The rated loads are determined according to EN13000 rating on the condition that the machine is stationed on firm, level ground.
- The figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.
- To calculate the maximum load that can actually be lifted, deduct weight of all lifting accessories, such as boom hook and jib hook, from figures shown above.
- Working radius is the horizontal distance from the slewing center to the center of gravity of a lifted load.
- The counterweight is 49.6 ton.
- Correlation between the number of reeved lines, maximum rated loads, hook weights are shown in the table below.

1. The rated loads are determined according to EN13000 rating on the condition that the machine is stationed on firm, level ground.

2. The figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.

3. To calculate the maximum load that can actually be lifted, deduct weight of all lifting accessories, such as boom hook and jib hook, from figures shown above.

Hook Capacity (t)	Hook Weight (t)
120	1.64
80	1.35
35	0.90
12	0.51

4. Working radius is the horizontal distance from the slewing center to the center of gravity of a lifted load.

5. The counterweight is 49.6 ton.

1. The rated loads determined according to EN13000 rating on the condition that the machine is stationed on firm, level ground.

2. The figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.

3. To calculate the maximum load that can actually be lifted, deduct weight of all lifting accessories, such as boom hook and jib hook, from figures shown above.

4. Working radius is the horizontal distance from the slewing center to the center of gravity of a lifted load.

5. The offset angles shown are of jib boom offset angle against the main boom, under load.

6. The counterweight is 49.6 ton.

7. Correlation between the number of reeved lines, maximum rated loads, hook weights are shown in the table below.

1. The rated loads are determined according to EN13000 rating on the condition that the machine is stationed on firm, level ground.

2. The figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.

3. To calculate the maximum load that can actually be lifted, deduct weight of all lifting accessories, such as boom hook and jib hook, from figures shown above.

4. Working radius is the horizontal distance from the slewing center to the center of gravity of a lifted load.

5. The counterweight is 49.6 ton.

6. Correlation between the number of reeved lines, maximum rated loads, hook weights are shown in the table below.

7. Cannot be used with 1 fall.

1. Max. clamshell rating is 10.0 t.
2. Mass of bucket plus load should not exceed clamshell ratings shown above. Following data are for a general digging application buckets.
 

Bucket capacity	2.0 m <sup>3</sup>
Bucket mass	4.5 t
3. In case of clamshell application, a 15.0 m boom is recommended as minimum length of boom, and max. boom length shall not exceed 27.0 m.
4. Apparent specific gravity of lifting material :
  - Earth ..... 1.7 to 1.8 t/m<sup>3</sup>
  - Gravel ..... 1.8 to 2.0 t/m<sup>3</sup>
5. A 49.6 t counterweight is required for all capacities on these charts.
6. Max. digging depth below ground shall be 36 m.
